Reading the mood of the market

Prices move on fundamentals, but also on fear and greed. The NXW sentiment indicators measure the mood and behaviour of investors in Vietnam and on world markets, and combine them into a single composite reading.

They track fear and greed, the put/call ratio, market breadth, foreign investor flows — a key driver of the Vietnamese market — and margin debt, which shows how much leverage investors are using.

Why it matters

The indicators feed the CCPS strategies and the PREDICTIONS page; extreme readings often signal turning points, but they are tools to support decisions, not forecasts on their own.

What Sentiment Indicators offers

Fear & Greed

A composite of market mood

Put/Call ratio

Hedging demand in options

Market breadth

How many stocks rise or fall

Foreign flows

Net buying of foreign investors

Margin debt

Leverage used by investors

Composite signal

Combined score feeding CCPS
